Digital Revolution: Dermatology Is on the Edge

Vincent A. DeLeo, MD

The Digital Revolution has invaded the House of Medicine, which is not really news since the invasion has been long-standing, but it seems to be generating more interest and concern in recent months. The American Medical Association recently created the Digital Health Implementation Playbook to lend guidance in developing technologies that are fundamentally altering the manner in which patients interact with health care providers. The playbook lays out specific steps for developing and implementing digital health technologies such as remote patient monitoring devices. The goal of the playbook is to make certain that such devices are accurate, reliable, and validated as valuable additions to high-quality patient care.

In January 2019 the Cutis website will merge with Dermatology News, our sister news publication, to become MDedge Dermatology (www.mdedge.com/dermatology). This site will be your new one-stop destination for timely news and clinical content you can trust from both publications. This interactive site is designed to help clinicians quickly find the information they need to improve the treatment and care of patients with conditions affecting the hair, skin, and nails. You will have free access to digital resources such as procedural videos, podcasts, image quizzes, board review, and resident resources, as well as an archive of Cutis content dating back to 2000.

As we at Cutis broaden our digital footprint, we look forward to providing our readers with a larger volume of clinically relevant content in more easily accessed formats while maintaining our commitment to valid trustworthy information. In the coming months we look forward to joining with you in this new digital endeavor, and as always, we appreciate the input of our readers during this process.
