<td>Behçet disease</td>
<td>Painful genital ulcers</td>
<td>Oral and genital aphthous ulcers; skin lesions present as sterile papulopustules and palpable purpura to erythema nodosum</td>
<td>Recurrent oral ulceration, recurrent genital ulceration, arthritis, ocular abnormalities (eg, uveitis, retinal vasculitis)</td>
<td>Azathioprine, cyclophosphamide, cyclosporine, methotrexate, TNF-α inhibitors, etanercept, infliximab, thalidomide</td>
<td>The presence of any 2 or more of the following indicates a diagnosis of Behçet disease: genital aphthosis, skin lesions, eye lesions, and positive pathergy test</td>
</tr>
<tr>
<td>Crohn disease</td>
<td>Suprapubic pain</td>
<td>Edema on the vulva, perianal skin tags, abscesses and/or fistulas, linear “knife-cut” ulcers in skin folds</td>
<td>Cutaneous lesions, joint involvement, ophthalmic disease</td>
<td>Systemic corticosteroids, methotrexate, sulfasalazine, or metronidazole either individually or in combination; intralesional triamcinolone injections (10–20 mg/mL)</td>
<td>Hidradenitis suppurativa with anogenital lesions sometimes is confused with Crohn disease; mutations in the NOD2, ATG16L1, and IRGM genes are present</td>
</tr>
<tr>
<td>Extramammary Paget disease</td>
<td>Pruritus is the initial symptom; burning; can be asymptomatic</td>
<td>Red plaques with a rough surface with erosions or white thickened islands on a keratinized genital epithelium</td>
<td>Urothelial carcinoma</td>
<td>Excision via Mohs surgery (&gt;1 mm invasion justifies evaluation of lymph nodes); laser surgery, radiation therapy, topical fluorouracil, imiquimod</td>
<td>Reported more often in individuals aged &gt;50 y; women are more often affected than men; 10%–20% of patients have underlying visceral malignancy</td>
</tr>
<tr>
<td>Pemphigus vulgaris</td>
<td>Painful erosions</td>
<td>90% of patients have mucosal involvement; erosions on the labia minora and majora, vagina, and cervix</td>
<td>Pemphigus vegetans is a variant that presents with erosions and peripheral pustules in early phases and vegetating and verrucous plaques in later phases</td>
<td>Mainstay of therapy is oral prednisone (60–150 mg/day) as well as steroid-sparing immunosuppressive agents (eg, azathioprine, cyclophosphamide); dapsone, antimalarials, cyclosporine, plasmapheresis and IVIG, mycophenolate mofetil, rituximab</td>
<td>Severely affected vulva exhibits resorption of the labia majora and clitoris with scarring</td>
</tr>

Abbreviations: TNF-α, tumor necrosis factor α; NOD2, nucleotide-binding oligomerization domain containing 2; ATG16L1, autophagy related 16-like 1; IRGM, immunity-related GTPase family M; IVIG, intravenous immunoglobulin; CO₂, carbon dioxide; VIN, vulvar intraepithelial neoplasia.
Practice Questions

1. A 5-year-old girl presented to your clinic with an itchy rash in the vulvar and anal regions. The patient’s mother reported erythema and erosion of the anal area. Her pediatrician prescribed an oral antibiotic that showed good results but the condition recurred 2 weeks after she finished the medication. The most likely diagnosis is:
   a. Behçet disease
   b. pemphigus vulgaris
   c. perianal streptococcal dermatitis
   d. plasma cell vulvitis
   e. vulvodynia

2. A 34-year-old woman presented with pain and a burning sensation on the vulva. She reported a history of migraines. On physical examination, mild erythema was noted on the labia majora and minora and the patient reported pain to the touch of a cotton-tipped applicator in the vestibule. The most likely diagnosis is:
   a. Crohn disease
   b. extramammary Paget disease
   c. pemphigus vulgaris
   d. plasma cell vulvitis
   e. vulvodynia

3. A 25-year-old woman with a history of oral ulcers presented to your clinic with pain in the genital area. On physical examination, multiple ulcers were noted on the labia majora with no discharge. The most likely diagnosis is:
   a. Behçet disease
   b. Crohn disease
   c. extramammary Paget disease
   d. pemphigus vulgaris
   e. plasma cell vulvitis

4. A 56-year-old woman presented to your clinic with vulvar pruritus and a burning sensation of 6 months’ duration. She had used a topical antibiotic and hydrocortisone cream 1% without relief. On physical examination, a red, irregular plaque is noted on the vestibule. The most likely diagnosis is:
   a. Behçet disease
   b. extramammary Paget disease
   c. pemphigus vulgaris
   d. plasma cell vulvitis
   e. vulvodynia

5. A 44-year-old woman presented to your clinic with pain and edema of the vulva. At physical examination, erythema and fissures were noted around the anus with fistulas involving the perianal skin. What is the most likely diagnosis?
   a. Behçet disease
   b. Crohn disease
   c. extramammary Paget disease
   d. pemphigus vulgaris
   e. plasma cell vulvitis

Fact sheets and practice questions will be posted monthly. Answers are posted separately on www.cutis.com.
