Major Finding: Two genetic variants with known associations to type 1 diabetes or celiac disease also predispose to juvenile idiopathic arthritis.

Data Source: DNA from 1,054 patients with juvenile idiopathic arthritis was compared with that of 3,129 healthy controls. Thirteen single nucleotide polymorphisms that had already been confirmed as associated with type 1 diabetes or celiac disease were investigated.

Disclosures: The study was sponsored by Arthritis Research U.K. and supported by the NIHR Manchester Biomedical Research Centre. Genotype data were used by the authors from the Medical Research Council and the Wellcome Trust.

The authors said that they had no financial disclosures.
