The actual fertility rate of 2.1 children per woman (over a lifetime) is just about half of what it was in the baby boom years. Teens, unmarried women, and older women all had more babies in 2007 than they did in previous years, Ms. Ventura said in an interview.

"The teen birth rate went up for the second year in a row. We have had an increase of 40% of births among women in the last few years, and though it’s too soon to say if this trend represents a reversal of the 34% decline in births to teens aged 15-19 reported between 1991 and 2005. Births to unmarried women made up 40% of the total births during 2007, Ms. Ventura noted. This really is a trend and has been increasing since 2002 at a pretty good clip. The year 2007 also boasted the highest number of births to women in the last 20 years. In fact, the largest increase in non-marital births occurred among women aged 25-39 years. I think the social stigma of being an unwed mother has pretty much disappeared," she said. However, about 40% of these births were to women in cohabitation relationships. About a third of births in the United States in 2007 were by C-section, said Joyce Martin, an epidemiologist with the center. She noted that the increase in cesarean section rate...".

More than 4.3 million babies were born in 2007, with increases in births seen across every age and race group. Births to unmarried women made up 40% of the total births.

Aldara Cream is indicated for the treatment of external genital, intra-vaginal, cervical, rectal, and intra-anal human papilloma viral disease. It is not known whether imiquimod is excreted in human milk. Because many drugs are excreted in human milk, caution should be exercised when Aldara Cream is administered to nursing women. Safety and efficacy in the treatment of urethral, intra-vaginal, cervical, rectal, or intra-anal human papilloma viral disease.

The increase among unmarried women occurred in all age groups, not just among teenagers. "Unmarried mothers used to be synonymous with teen mothers, but not any more," Ms. Ventura said. "Sixty percent of births to women in their early 20s were to unmarried mothers, as were almost one-third of births to women in their later 20s." In fact, the largest increase in non-marital births occurred among women aged 25-39 years. I think the social stigma of being an unwed mother has pretty much disappeared," she said. However, about 40% of these births were to women in cohabitation relationships. About a third of births in the United States in 2007 were by C-section, said Joyce Martin, an epidemiologist with the center. She noted that the increase in cesarean section rate...
