TORONTO—Pediatricians often prescribe medications for psychiatric disorders with an insufficient knowledge base and little collaborative help from psychiatrists, according to results of a cross-sectional survey presented at the annual meeting of the Society for Developmental and Behavioral Pediatrics.

“Having done this survey, we are very concerned that inadequate psychiatric- 

pediatrician communication may lead to mismanagement of children with psychi-

tic disorders,” commented lead investigator Wendy Ross, M.D., of Children’s Hospital Boston and Harvard University, Boston.

In the primary care diagnosis and management of psychiatric disorders in children have created a need for more

psychotherapists knowledge among

pediatricians and a demand for accessible collaborative psychiatric care, Dr. Ross said.

Investigators mailed surveys to 260 pedi-

atricians randomly selected from the Massachusetts chapter of the American Academy of Pediatrics and received 100

responses.

The mean age of respondents was 47 years, 45% were female, and the mean duration of practice was 16 years.

Almost all pediatricians (98%) reported

pediatricians and a demand for accessible collaborative psychiatric care, Dr. Ross said.
