Many patients go undiagnosed or misdiagnosed for long periods. If one is in doubt about cutaneous symptoms, getting a biopsy and cultures is worthwhile.

As a result, many patients with strange fungal infections go undiagnosed or misdiagnosed for long periods. Most of them have different things, especially in immunocompromised patients. For example, Cryptococcus infection can look like Kaposi’s sarcoma, bacterial cellulitis, molluscum, or even herpes,” said Dr. Rosen of the department of dermatology, Baylor College of Medicine, Houston. “In HIV-positive patients, all morphologic possibilities are off.”
