Protease Inhibitors for Hepatitis C Virus

ADDRESS: Nizar N. Zein, MD, Department of Gastroenterology and Hepatology, A31, Cleveland Clinic, 9500 Euclid Avenue, Cleveland, OH 44195; e-mail zeinn@ccf.org.

CORRECTION

In the article “Presumed premature ventricular contractions” by Drs. Moises Auron and Donald Underwood (Clev Clin J Med 2011; 78:812–813), FIGURE 1 was incorrectly labelled. The corrected figure and legend appear below. The authors wish to thank Philippe Akhrass, MD, from the State University of New York, Brooklyn, and Shahrokh Rafit, MD, from Brookdale University Hospital and Medical Center, Brooklyn, NY, for pointing out this error.

FIGURE 1. The electrocardiogram shows atrial fibrillation. Following the seventh beat, the cycle length “A” is longer than the subsequent cycle “B,” giving a long-short sequence that ends in an aberrantly conducted beat that has terminal broadening and a right-bundle-branch-type pattern (white arrow). This is a typical Ashman sequence. The next beat in sequence is slightly aberrant but is returning to the baseline QRS configuration.
